## FICTION

## FACT

The vaccine will make me infertile

There is no evidence that the COVID vaccines cause fertility problems in women or men.

The vaccine will alter my DNA

COVID vaccines do not interact with or change DNA. They provide our immune systems with the information it needs to fight the virus in the future.

The vaccines don't work because people are still getting COVID

Vaccines are effective in preventing serious illness, hospitalization & death from COVID, but they do not prevent infection completely.

The vaccine has harmful side effects

It is normal to experience mild side effects after vaccination, but serious adverse events are rare.
